zx64 keyboard

The ZX81's legends on the C64 keys. Letters, digits and `.` are where the C64 has them; everything else is the ZX81's own SHIFT, keyword and function layer. Read from your ROM's key tables.

ON THE C64 KEYBOARD

above the key: keyword, at the **K** cursor top right: with SHIFT below the key: function, after SHIFT RETURN bottom right: block graphic, SHIFT in graphics mode dashed: not used

THE CURSOR TELLS YOU WHAT A KEY GIVES

K Keyword

Start of a line, or after THEN. A letter gives the keyword above it: `P` is PRINT, `K` is LIST. Digits give a line number.

L Letters

Everywhere else. Keys give their letter; SHIFT gives the red legend: `SHIFT` `P` is ", `SHIFT` `L` is =.

F Function

`SHIFT` `RETURN`, then one key: the function below it. `B` is INKEY$, `T` is RND, `M` is PI.

G Graphics

`SHIFT` `9` in, `SHIFT` `9` out. Plain keys give inverse characters; SHIFT gives the block graphic in the key's corner.

C64 KEYS THAT ZX64 ADDS

C64 KEY	ZX81
RETURN	NEWLINE. SHIFT RETURN is FUNCTION
INST/DEL	RUBOUT (the ZX81's SHIFT 0)
CRSR ↕ CRSR ↔	Down and right; with SHIFT, up and left (the ZX81's SHIFT 6, 8, 7, 5)
← ↑	Cursor left and up
SPACE RUN/STOP	BREAK while a program runs
SHIFT LOCK	Holds the left SHIFT down, as on the C64
SHIFT 1	EDIT: brings the current line down to be changed
F1	Type-ahead on or off. On (the default), every key is taken however fast you type, as on a C64; off, the ROM's own way: one key at a time, all keys up in between. The top row says which, for 2 seconds
F2	(SHIFT+F1) The colours: black on white, white on black, green screen, amber, black on green, the C64's own. The top row names each; F7, F3 and the monitor keep it
F3	Memory: 16K, 32K, 1K, 16K again. Like swapping the RAM pack with the power off: the ZX81 starts again and the program is gone. The top row says the size
F5	The machine code monitor: stops the ZX81 where it is and shows its registers, on a C64 screen of its own. F5 again, or X, carries on
F6	(SHIFT+F5) The joystick in port 2: the next layout, 5678+0, QAOP, ZXKM and your own, its keys on the top row. Held a second: the ZX81 stops and asks for your own keys, up, down, left, right, fire (F1: none, F5: give up)
F7	Reset: the ZX81 starts again, as at power on, when the key comes up. Works at the prompt, in SLOW mode, and between BASIC statements in FAST mode

INDEX

With SHIFT

-	J
,	.
;	X
:	Z
?	C
"	P
""	Q
(	I
)	O
*	B
**	H
/	V

ATN	D
CHR$	U
CODE	I
COS	W
EXP	X
INKEY$	B
INT	R
LEN	K
LN	Z
NOT	N
PEEK	O
PI	M
RND	T
SGN	F
SIN	Q
SQR	H
STR$	Y
TAB	P
TAN	E
USR	L
VAL	J

Legends are decoded from the ROM's tables (K-UNSHIFT, K-SHIFT, K-FUNCT, K-GRAPH and the token table), so they match what your zx64 build does. The C64's own + - = : and so on do nothing: use the ZX81's SHIFT legends.
